Abstract:

Customer support teams receive a large volume of tickets every day. When prioritization and assignment are performed manually, urgent issues can wait behind routine requests, response times grow, and customer satisfaction suffers. This project addresses that problem with a Salesforce-based solution that combines an **Auto-Launched Flow** with an **Agentforce subagent** to classify, prioritize and route support tickets automatically.

A custom object, **Support Ticket Intelligence** (`Support_Ticket_Intelligence__c`), stores each ticket together with its Account, Contact, issue type, description, priority, status, assignment, SLA-risk flag and resolution time. The Flow accepts an Account Name, retrieves the latest ticket for that Account, analyzes the ticket description against configured keyword conditions, and sets the priority to High, Medium or Low. For High-priority tickets the Flow creates an **Urgent Ticket Handling** task and assigns the ticket to a senior support agent. A final action message is returned to the user.

The Flow is exposed to users as an agent action inside an Agentforce subagent named **Support Ticket Priority Analysis**. A support user simply provides an Account Name in conversation and receives the Account Id, Ticket Id, priority level, assigned agent and action message. The result is faster identification of critical tickets, reduced manual effort and a conversational interface to ticket handling.

Keywords

Salesforce, Agent force, Auto-Launched Flow, Ticket Prioritization, Support Automation, SLA Risk, Custom Object, Subagent, Agent Action.

1. Introduction :

Project Overview:

Customer support is one of the most visible functions of any organization. Every ticket represents a customer who is waiting for an answer, and the order in which tickets are handled has a direct effect on satisfaction and trust. In many support teams, tickets are read, judged and assigned by people. This is slow, inconsistent and difficult to scale as ticket volumes grow.

The **Customer Support Ticket Priority Prediction and Automated Assignment System** provides a Salesforce-based answer. It analyzes ticket information, classifies urgency, assigns the appropriate support level and starts automation for critical cases. Salesforce Flow carries out the business logic, while Agentforce provides a natural-language entry point so that support users can trigger and review the analysis through conversation.

Purpose and Objectives:

The purpose of the project is to reduce the delay between a ticket being raised and the right person starting work on it. The specific objectives are:

- Automatically classify support tickets as **High, Medium or Low** priority.
- Retrieve the **latest support ticket** associated with a customer Account.
- Reduce manual prioritization and assignment effort for support teams.
- Create an **urgent handling task** for High-priority tickets.
- Assign High-priority tickets to a **senior support agent**.
- Use **Agent force** to analyze ticket details and trigger backend automation conversationally.
- Improve ticket response and resolution efficiency and provide basic SLA-risk awareness.

Scope:

In Scope

- Custom object for storing ticket data with Account, Contact and User relationships.
 - Auto-Launched Flow with keyword-based priority analysis, task creation, agent assignment and final message generation.
 - Optional SLA-risk decision based on ticket age.
 - Agent force subagent and a Flow-based agent action with defined inputs and outputs.
-

Out of Scope

- Billing, subscription management and account-update requests (explicitly excluded from the subagent scope).
- Direct record updates or e-mail sending by the agent; all actions are performed through the Flow.
- Advanced analytics, dashboards and comprehensive SLA escalation (identified as future scope).

Stakeholders:

Stakeholder	Interest in the Solution	How the System Helps
Support Agent	Wants to focus on critical issues first	Tickets are prioritized automatically and urgent tasks are created
Customer	Wants urgent issues resolved quickly	Critical issues are identified and routed to senior agents sooner
Support Manager	Wants balanced workload and SLA control	Automatic assignment and SLA-risk awareness reduce manual decisions
AI Agent (Agent force)	Needs structured actions to execute	Flow-based agent action provides defined inputs and outputs
System Administrator	Needs maintainable configuration	Flow and subagent can be updated without custom code

User Stories :

1. **As a Support Agent**, I want tickets to be automatically prioritized so that I can focus on critical issues first.
2. **As a Customer**, I want urgent issues to be resolved quickly so that my experience improves.
3. **As a Manager**, I want tickets to be assigned automatically to the right team so that workload is balanced.
4. **As an AI Agent (Agent force)**, I want to analyze ticket details and trigger automation so that manual work is reduced.

Expected Outcomes :

- Faster ticket resolution
 - Improved customer satisfaction
 - Reduced manual effort
 - Intelligent ticket handling
 - Better team productivity
-

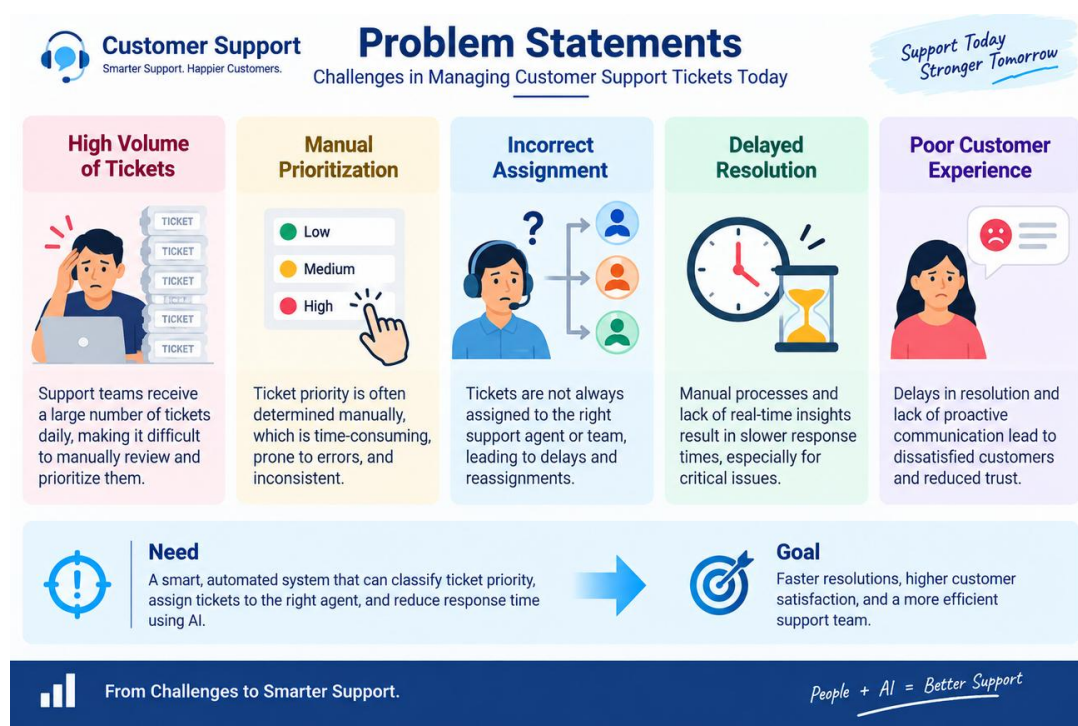

2. Ideation Phase :

The ideation phase captured who is affected by the problem, what they experience, and which solution idea offers the best balance of impact and feasibility.

Problem Statement:

Using the customer problem statement template, five problem statements were identified across the support agent, customer and support manager personas.

ID	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	Support Agent	focus on critical tickets first	tickets are not always prioritized automatically	ticket prioritization can be manual	Frustrated
PS-2	Customer	get urgent issues resolved quickly	critical issues may wait behind lower-priority tickets	support teams handle large ticket volumes	Concerned
PS-3	Support Manager	assign tickets to the right support level	assignment may require manual decisions	ticket urgency is not consistently analyzed	Overwhelmed
PS-4	Support Agent	identify urgent issues from descriptions	important keywords can be missed	descriptions contain different urgency signals	Uncertain
PS-5	Support Manager	reduce SLA-related risk	older unresolved tickets may remain unnoticed	SLA risk needs additional checking	Concerned

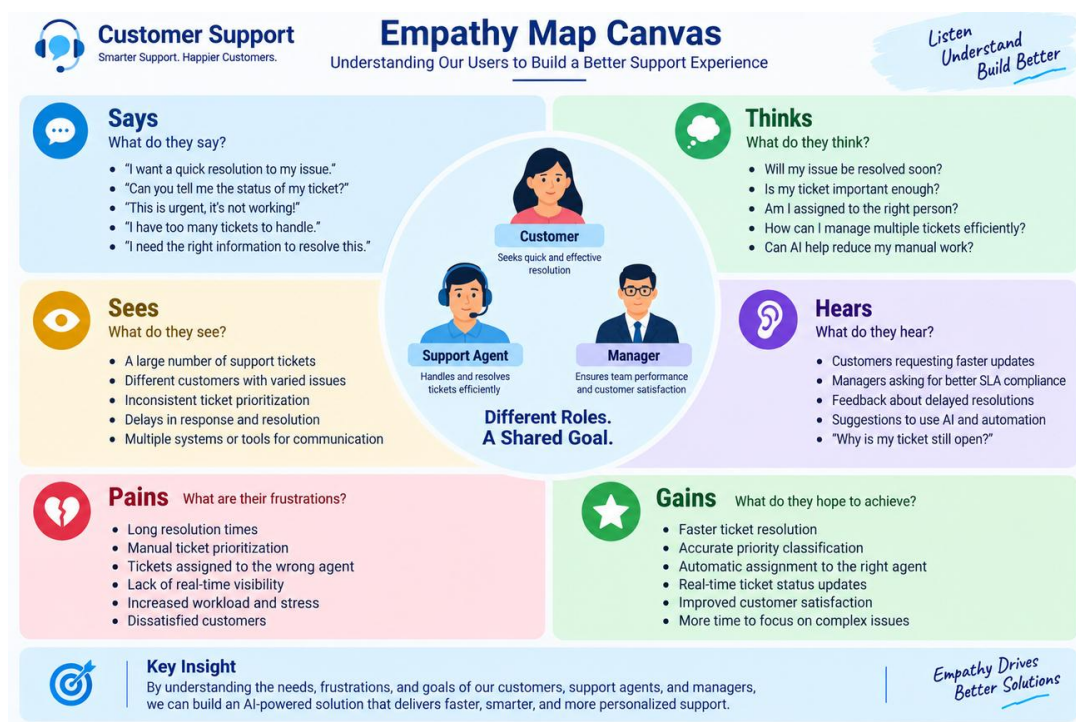

Problem statements: challenges in managing customer support tickets today

The infographic summarizes five recurring challenges - high ticket volume, manual prioritization, incorrect assignment, delayed resolution and poor customer experience - and states the resulting need: a smart, automated system that classifies ticket priority, assigns tickets to the right agent and reduces response time using AI.

Empathy Map Canvas :

User persona: Support Agent. The empathy map describes what the agent thinks, hears, sees, says and does, together with the pains and gains that the solution must address.

Dimension	Support Agent Perspective
Think & Feel	Wants critical issues identified quickly so urgent customer problems receive attention.
Hear	Receives customer issue descriptions and support requests.
See	Ticket status, issue type, description, priority level, assignment and SLA risk.
Say & Do	Reviews tickets, handles assigned cases and focuses on urgent support issues.
Pain	Manual prioritization, missed urgency signals and delays in handling critical tickets.
Gain	Automatic priority classification, clearer assignment, urgent-task creation and reduced manual effort.

canvas for customer, support agent and manager roles Empathy map

Key insight: by understanding the needs, frustrations and goals of customers, support agents and managers, the project can deliver an AI-powered solution that is faster, smarter and more personalized.

Brainstorming and Idea Prioritization:

Ideas Considered

- Manual ticket registers
- Spreadsheet-based ticket tracking
- Standalone support portal
- Salesforce CRM with Agentforce

Final Selection

Salesforce CRM with Agentforce was selected because it provides:

- Automation through Salesforce Flow
- AI-assisted ticket analysis through Agentforce
- Automatic priority classification
- Automatic urgent-task creation
- Reduced manual support effort

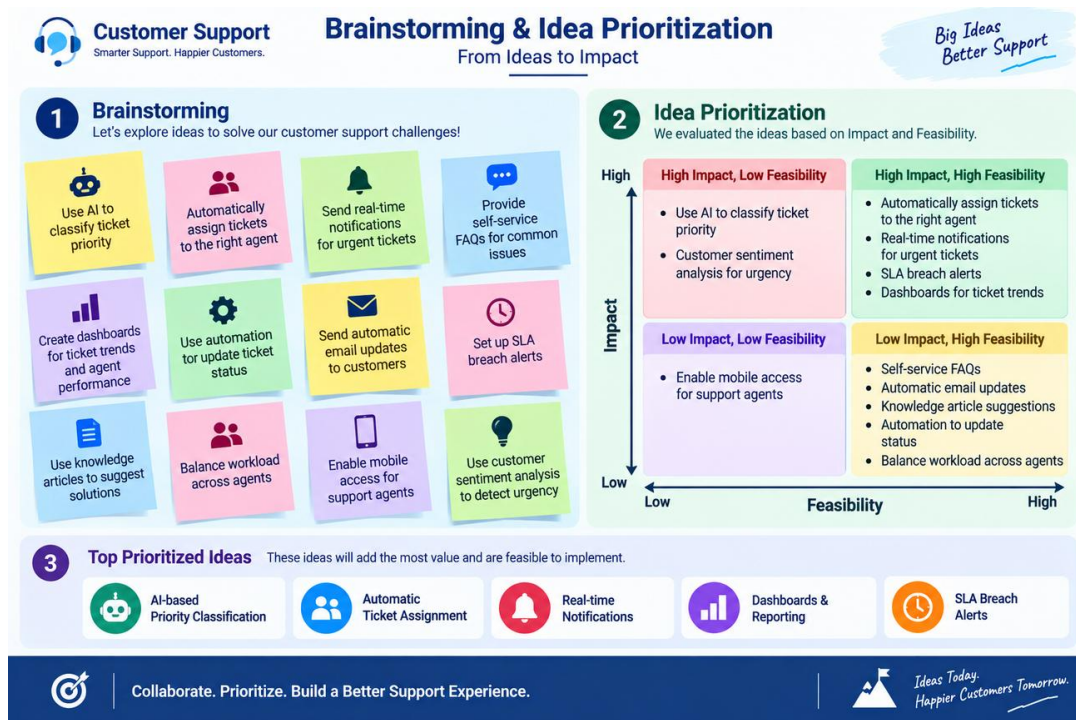

Figure 3: Brainstorming and idea prioritization by impact and feasibility

Ideas were mapped on an impact-versus-feasibility grid. The top prioritized ideas were AI-based priority classification, automatic ticket assignment, real-time notifications, dashboards and reporting, and SLA breach alerts. The current implementation delivers the first two together with an optional SLA check; the remainder are carried into the future scope.

3. Requirement Analysis Phase

Customer Journey Map:

The customer journey follows a ticket from creation to resolution:

Ticket Creation → Account Identification → Ticket Retrieval → Description Analysis → Priority Classification → Agent Assignment → Urgent Task Creation → Support Handling → Resolution

Customer journey map from issue to resolution

At each stage the map records customer actions, touchpoints, feelings, system actions and outcomes. The customer moves from frustration when raising an issue, to optimism once AI analysis is complete, to satisfaction when the issue is resolved and feedback is captured.

Solution Requirements:

Functional Requirements

FR No	Requirement	Delivered By
FR-1	Support ticket creation and management	Support Ticket Intelligence custom object
FR-2	Account and Contact association	Customer__c and Contact__c lookups
FR-3	Ticket description analysis	Flow decision "Analyze Description"
FR-4	Automatic priority classification	Flow assignments setting varPriorityLevel
FR-5	High-priority task creation	Flow "Create Records" on Task
FR-6	Support agent assignment	Flow assignment setting varAssignedTo
FR-7	SLA breach risk checking	Optional SLA decision (ticket older than 2 days)
FR-8	Agentforce conversational analysis	Subagent and Flow-based agent action

Non-Functional Requirements

NFR	Description
Usability	Clear Agentforce interaction and understandable priority messages
Reliability	Consistent priority classification based on configured conditions
Performance	Quick retrieval and analysis of the latest support ticket
Security	Controlled Salesforce access to customer and ticket information
Maintainability	Flow and Agentforce configuration can be updated
Scalability	Supports increasing support-ticket volumes through Salesforce automation

Data Flow Diagram:

Process flow: Customer / Support Request → Account → Latest Support Ticket → Ticket Description → Analyze Description → Priority Level → High / Medium / Low Decision → Agent Assignment → High-Priority Task (if applicable) → Final Response.

Agent force flow: User provides Account Name → Agent force Support Ticket Priority Analysis → Auto-Launched Flow → Ticket Analysis → Priority and Assignment Output → Response to User.

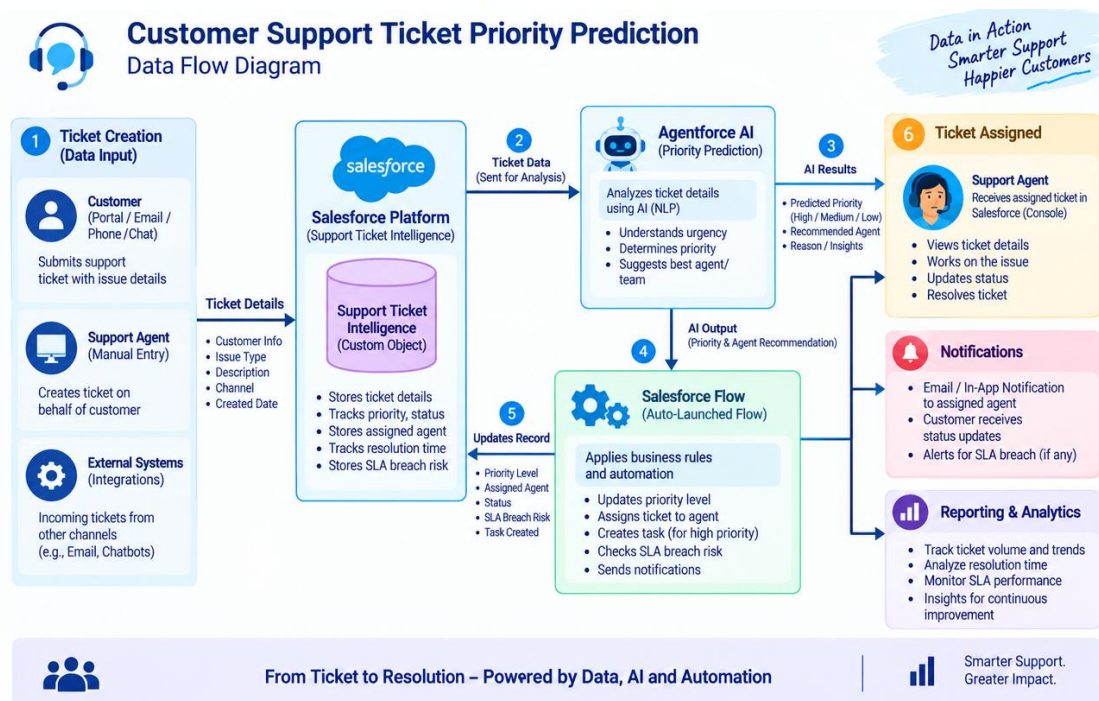

Figure 5: Data flow diagram for ticket priority prediction

Technology Stack:

Layer	Technology
Platform	Salesforce
Database	Support_Ticket_Intelligence__c with Account, Contact, User and Task records
Logic	Auto-Launched Flow
AI	Agent force
Agent Configuration	Support Ticket Priority Analysis subagent
Automation	Flow Decision, Assignment and Create Records elements
Output	Agentforce conversation response

4. Project Design Phase

Problem-Solution Fit:

Problem	Solution	Benefit
Manual ticket prioritization	Flow analyzes description and sets priority	Faster identification of urgent cases
Urgent issues may be missed	High-priority keyword decision	Critical cases receive attention
Manual task creation	Flow creates a Task for High priority	Reduced manual effort
Manual support assignment	Flow sets assigned support level	More consistent handling
SLA risk can be overlooked	Optional SLA Risk decision	Better risk awareness
Need for conversational access	Agentforce subagent	AI-assisted interaction

Figure 6: Problem-solution fit

Proposed Solution:

Problem	Manual ticket prioritization and assignment causing delays in handling critical customer support issues
Solution	Salesforce-based Customer Support Ticket Priority Prediction and Automated Assignment System
Innovation	Agentforce AI + Auto-Launched Flow for analyzing ticket descriptions, automatically classifying priority, assigning support level and triggering urgent-task automation

Impact	Faster identification of critical tickets, reduced manual effort, improved response time and better support-team productivity
Business Model	Customer support operations involving customers, support agents, support managers and AI-assisted ticket handling
Scalability	Supports increasing ticket volumes through Salesforce automation, with scope for additional assignment rules, SLA monitoring and priority indicators

Solution Architecture:

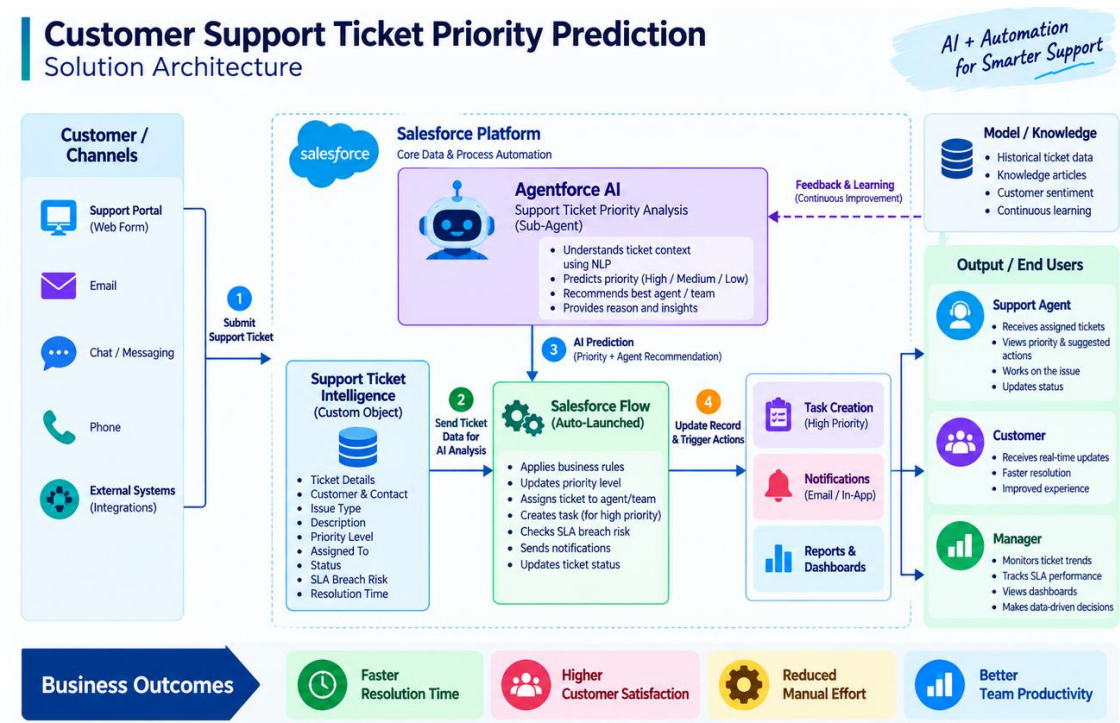

Figure 7: Solution architecture on the Salesforce platform

Tickets arrive from channels such as a support portal, e-mail, chat, phone and external systems and are stored in the Support Ticket Intelligence object. Agentforce passes the Account Name to the Flow; the Flow applies business rules, creates tasks and updates outputs; and agents, customers and managers receive the results through their respective views.

5. Project Planning and Scheduling

Project Planning:

- **Agile methodology** with short, goal-driven sprints.
- **Epics** → **Stories** → **Story Points** to break down and size the work.
- **Sprint-based execution** with a defined start, end and release date per sprint.
- **Velocity calculation** used for estimation of future sprints.

Product Backlog and Sprint Schedule:

Sprint	Epic	USN	User Story / Task	Pts	Priority	Owner
Sprint-1	Developer Setup	USN-1	As a system administrator, I want to configure the Salesforce environment for Support Ticket Intelligence so that the support automation solution can be developed.	3	High	Member1
Sprint-2	Data Modeling	USN-2	As an admin, I want to create the Support Ticket Intelligence object with required fields and relationships so that customer support ticket information is stored systematically.	5	High	Member2
Sprint-2	Data Modeling	USN-3	As a support user, I want support tickets to be associated with Accounts and Contacts so that the latest customer ticket can be identified for analysis.	3	High	Member3
Sprint-3	Automation	USN-4	As a support agent, I want an Auto-Launched Flow to retrieve the latest ticket and analyze its description so that ticket priority can be determined automatically.	5	High	Member4
Sprint-3	Automation	USN-5	As a support agent, I want tickets to be automatically classified as High, Medium or Low based on configured urgency conditions so that critical issues receive attention first.	5	High	Member4
Sprint-4	Agentforce & Automation	USN-6	As an AI Agent (Agentforce), I want to analyze support ticket details and trigger the backend Flow so that manual ticket prioritization is reduced.	8	High	Member1

Sprint	Epic	USN	User Story / Task	Pts	Priority	Owner
Sprint-4	Task & Assignment	USN-7	As a support manager, I want High-priority tickets to automatically create an urgent handling task and assign the appropriate support level so that critical tickets are handled quickly.	5	High	Member2
Sprint-5	SLA Management	USN-8	As a support manager, I want the system to check SLA breach risk for older unresolved tickets so that potential SLA issues can be identified.	5	Medium	Member3
Sprint-6	Agentforce & Conversational Support	USN-9	As a support user, I want to provide an Account Name to Agentforce and receive the ticket ID, priority, assigned agent and action message so that I can understand the ticket handling outcome conversationally.	5	Medium	Member4

6. Project Development Phase

The development phase is organized into six milestones. Learning areas touched by the project include data modelling, fields and relationships, Salesforce Flow, and Agentforce configuration. The implementation is declarative: no Apex code is required for the documented solution.

Milestone 1: Salesforce Developer Account

Creating a Developer Account

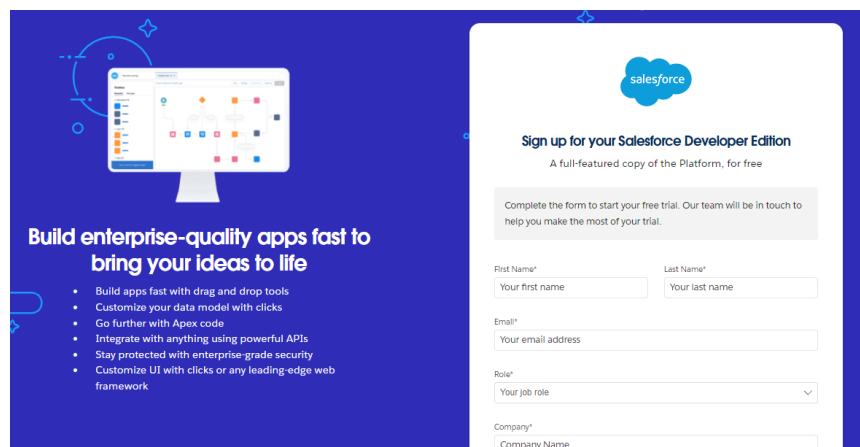

The image shows the Salesforce Developer Edition sign-up form. On the left, there's a blue banner with the text "Build enterprise-quality apps fast to bring your ideas to life" and a list of bullet points: "Build apps fast with drag and drop tools", "Customize your data model with clicks", "Go further with Apex code", "Integrate with anything using powerful APIs", "Stay protected with enterprise-grade security", and "Customize UI with clicks or any leading-edge web framework". On the right, the form is titled "Sign up for your Salesforce Developer Edition" and includes a sub-header "A full-featured copy of the Platform, for free". Below this, it says "Complete the form to start your free trial. Our team will be in touch to help you make the most of your trial." The form fields include: "First Name*" (Your first name), "Last Name*" (Your last name), "Email*" (Your email address), "Role*" (Your job role, a dropdown menu), and "Company*" (Company Name).

Figure 8: Salesforce Developer Edition sign-up form

Account Activation

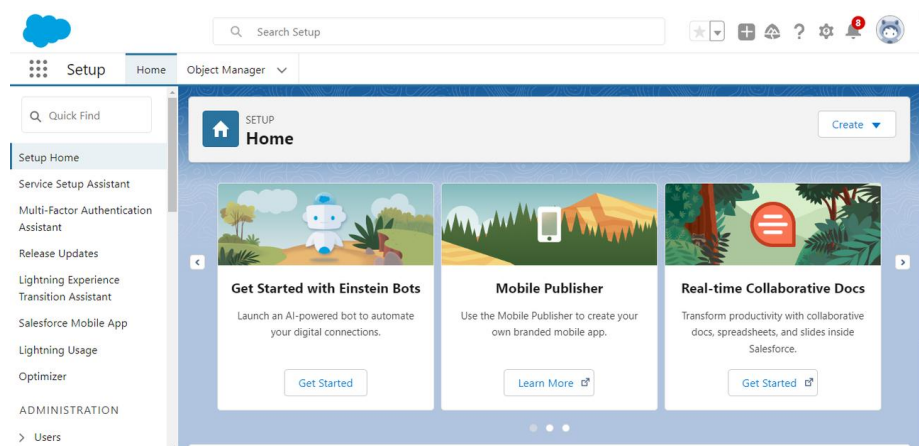

Figure 11: Salesforce Setup home page after activation

Milestone 2: Data Management - Custom Object

A single custom object stores all ticket information. It links each ticket to a customer Account and Contact and to the support agent who owns it.

Object Name	Support Ticket Intelligence
API Name	Support_Ticket_Intelligence__c

Fields

Support Ticket Intelligence

Figure 12: Sample ticket record TKT-0002 with its urgent tasks

Milestone 3: Auto-Launched Flow

Final Flow Structure

The canvas shows a single decision with three branches. The High branch creates the task, sets the assigned agent and sets the final message; the Medium and Low branches set their messages and end.

Milestone 4: Agentforce Configuration/Final Outcome

Agentforce is enabled in the org and the default agent is opened in Agentforce Builder so that a new subagent can be added.

The screenshot displays the Agentforce Builder interface. On the left, a 'Support Ticket Intelligence' panel shows details for ticket 'TKT-0001'. The 'Details' tab is active, displaying fields such as Ticket Number, Customer, Issue Type, Description, Priority Level, Status, Assigned To, Created Date, SLA Breach Risk, Resolution Time (hrs), and Created By. The 'Assigned To' field is populated with 'Srinath B.'. The 'Created By' field is also 'Srinath B.', and the 'Created Date' is '10/2/2016, 11:39 PM'. The 'Last Modified By' is 'Srinath B.' and the 'Last Modified' date is '10/3/2016, 6:33 AM'. On the right, the 'Agentforce (Default)' panel is open, showing a chat interface with a user 'Hii' and a response 'Hello! How can I assist you today?'. Below the chat, there are sections for 'Activity' and 'Upcoming & Overdue' tasks. The 'People' section lists users associated with the ticket, including 'Full Name', 'Title', 'Phone', and 'Email'.

Agentforce is AI and can make mistakes.

7. Functional and Performance Testing

Testing was carried out in the Salesforce org using the Flow debug options, record pages and the Agentforce Conversation Preview. Screenshots were captured to validate ticket creation, Account and Contact association, priority classification, urgent-task creation, agent assignment and the conversational response.

Functional Test Cases:

ID	Test Scenario	Test Input	Expected Result	Result
TC-01	Create a ticket record	New Support Ticket Intelligence record with all fields	Record saved; Ticket Number auto-generated as TKT-{0000}	Pass (TKT-0002)
TC-02	Account and Contact association	Customer = Abdul; Contact = abdul rahaman	Ticket shows related Account and Contact	Pass
TC-03	High-priority classification	Description = "Urgent"	Priority Level = High	Pass
TC-04	Urgent task creation	High-priority ticket analyzed by Flow	"Urgent Ticket Handling" task related to the ticket, Priority High, Not Started	Pass (see note 2 in 7.3)
TC-05	Agent assignment for High	High-priority ticket	varAssignedTo = "Senior Support Agent"	Pass
TC-06	Medium-priority classification	Description containing "slow" or "delay"	varPriorityLevel = Medium; message "will be handled shortly"	To be executed
TC-07	Low-priority classification	Description with no keywords	varPriorityLevel = Low; message "queued for processing"	To be executed
TC-08	Agent requests missing input	Start conversation without an Account Name	Agent asks the user for the Account Name	Pass
TC-09	Agent returns Flow outputs	Account Name = "ABC"	Account Id, Ticket Id, priority, assigned agent and message are displayed	Pass - see note 1 in 7.3
TC-10	Out-of-scope request	Ask about billing or subscription changes	Agent declines and stays within ticket-priority scope	To be executed
TC-11	Account not found	Account Name that does not exist	Graceful message; no task created	To be executed

Performance and Non-Functional Validation:

Area	Validation Approach	Observation
Usability	Review Agentforce prompts and returned messages	Prompt for Account Name is clear; loading text shows progress

Area	Validation Approach	Observation
Reliability	Run identical descriptions repeatedly	Keyword conditions give consistent classification
Performance	Observe response time of the action in Conversation Preview	Single-record retrievals return promptly; the Flow uses two Get Records and one Create Records element
Security	Review user access to object, fields and Flow	Access is governed by standard Salesforce profiles and permission sets
Maintainability	Change a keyword in the Decision element	Update applies after saving and re-activating the Flow

Observations and Recommendations:

Reviewing the captured evidence surfaced several points that should be addressed to make the solution more robust. They are recorded here as findings with suggested remedies.

#	Observation	Recommendation
1	In the Conversation Preview for account "ABC", the returned message says the ticket is low priority, while the returned priority is High and the assigned agent is Senior Support Agent. Values from different branches appear together.	Run the Flow in debug mode with the same account and confirm that the output variables are populated from one execution path. Make sure every branch sets all five outputs, and map the message output explicitly in the action.
2	The ticket record shows two "Urgent Ticket Handling" tasks. Each execution of the action creates a new Task.	Before Create Records, check for an existing open task for the same WhatId and subject, and skip creation if one exists.
3	The Flow computes priority and assigned agent in variables, but the documented steps contain no Update Records element for the ticket.	Add an Update Records element to write Priority_Level__c, Assigned_To__c and SLA_Breach_Risk__c back to the ticket.
4	The assigned agent is a text label ("Senior Support Agent"), whereas Assigned_To__c is a User lookup.	Resolve the label to a real User or Queue Id, or use a round-robin / workload-based assignment.
5	The Get Account and Get Ticket elements assume a record is found.	Add a Decision after each Get Records to handle "not found" and return a friendly message.
6	The Medium keyword "issue" is very common and may classify many tickets as Medium.	Review the keyword list regularly with support managers and consider additional signals such as Issue Type or customer tier.

8. Advantages and Disadvantages

Advantages:

Advantage	Description
Automatic Ticket Prioritization	Classifies support tickets as High, Medium or Low based on the ticket description.
Faster Identification of Critical Issues	Helps support agents focus on urgent tickets first.
Reduced Manual Effort	Automates ticket analysis, priority setting, task creation and assignment.
Intelligent Ticket Handling	Agentforce analyzes ticket details and initiates the appropriate backend automation.
Automatic Urgent Task Creation	High-priority tickets automatically create an Urgent Ticket Handling task.
Improved Support Assignment	Assigns High-priority tickets to the appropriate support level, including a senior support agent.
Conversational Support	Support users interact with Agentforce to analyze ticket information and receive the outcome.
Better Response Time	Automation helps reduce delays in handling critical customer issues.
SLA Risk Awareness	The solution can check older unresolved tickets for potential SLA breach risk.
Scalable Support Operations	Salesforce automation can support increasing volumes of support tickets.
Improved Team Productivity	Reduces repetitive work and lets teams concentrate on ticket resolution.

Disadvantages:

Limitation	Description
Keyword-Based Priority Logic	Classification depends on configured keywords such as urgent, not working, failure, issue, slow and delay.
Limited Understanding of Context	The implementation may not capture every urgency signal because it relies on configured conditions.

Limitation	Description
Dependence on Accurate Ticket Data	Correct Account, Contact and ticket information is required for successful analysis.
Flow Configuration Dependency	Changes to ticket handling require maintenance of the Auto-Launched Flow and its logic.
Agentforce Configuration Dependency	Responses and actions depend on properly configured subagent instructions and Flow actions.
Limited Scope of Agentforce	The subagent focuses on ticket analysis, priority and backend automation; billing or subscription requests are out of scope.
Limited SLA Monitoring	The current implementation includes an optional SLA-risk check rather than full SLA monitoring and escalation.
Assignment Logic May Need Expansion	Additional teams or more sophisticated assignment rules require further configuration.
Maintenance Required	Keywords, Flow variables, Agentforce outputs and assignment logic may need updates as requirements evolve.
Limited Analytics	Advanced analytics for priority trends and resolution performance are future scope.

Conclusion:

The Customer Support Ticket Priority Prediction and Automated Assignment System demonstrates how Salesforce Flow and Agentforce can work together to reduce manual support-ticket handling. The solution retrieves the latest ticket for an Account, analyzes its description, classifies priority, creates an urgent task for High-priority cases, assigns a support level and returns a clear conversational response.

This supports faster ticket handling, reduced manual effort, intelligent prioritization and better team productivity. The declarative design - one custom object, one Auto-Launched Flow and one Agentforce subagent with a single action - keeps the solution easy to understand, maintain and extend.

The testing review also identified practical refinements: writing results back to the ticket record, preventing duplicate tasks, handling missing records and resolving the assigned agent to a real user or queue. Applying these refinements, together with the future-scope items below, will move the solution from a working prototype to a production-ready support automation capability.

Thank You
