

PHASE 1

Requirement Analysis and Planning

Customer Support Ticket Priority Prediction
and Automated Assignment System

Item	Details
Platform	Salesforce
AI capability	Agentforce
Automation	Salesforce Flow
Phase	Phase 1: Requirement Analysis and Planning
Document type	Project requirement documentation

1. Business Requirements

1.1 Business Context

Support teams often receive a large number of tickets every day. When agents have to prioritize and assign each ticket by hand, urgent problems can get missed, customers wait longer for a response, and some agents end up with far more work than others.

This project proposes a Salesforce solution in which Agentforce reads the details of each support ticket and decides how urgent it is. Salesforce Flow then handles the follow-up automation, including assigning the ticket to the right person.

1.2 What the Business Needs

- Manage all customer support tickets in one place within Salesforce.
- Classify every ticket as High, Medium, or Low priority.
- Read the ticket description and pick up signs of urgency.
- Assign each ticket to a suitable support agent or support level.
- Create a follow-up task automatically for every high-priority ticket.
- Track the status of each ticket and how it was resolved.
- Flag tickets that are at risk of missing their SLA.
- Give managers a clear view of ticket status and team workload.
- Provide reports and dashboards for day-to-day monitoring.

2. Project Scope and Objectives

2.1 Scope

The project covers the design and build of a Salesforce solution that manages support tickets and uses automation to analyze priority and support assignment.

In scope	Out of scope
Creating and managing support tickets	Payment processing
Priority classification	Subscription management
Analysis of ticket descriptions	Direct billing management
Automated assignment support	Account-management work unrelated to support
Task creation for high-priority tickets	
Identifying SLA risk	
Reports and dashboards	
Ticket analysis using Agentforce	

2.2 Objectives

- Cut down the manual effort spent on prioritizing tickets.
- Spot high-priority tickets early.
- Make ticket assignment more consistent.
- Improve the overall efficiency of the support team.

- Give the team clear visibility of ticket status and workload.
- Make sure urgent customer issues are handled on time.
- Support management reporting through Salesforce analytics.

3. User Needs

The requirements below are written from the point of view of four parties: the customer, the support agent, the support manager, and the Agentforce service agent.

Stakeholder	What they need	User story
Customer	Submit a support request with details of the issue, and get quick attention when the issue is urgent.	As a customer, I want urgent issues to be handled quickly so that my problem is resolved without delay.
Support agent	See assigned tickets, understand the priority, update the status, and focus on critical tickets first.	As a support agent, I want tickets to be prioritized automatically so that I can focus on the most important ones first.
Support manager	Monitor ticket status, priority, workload, SLA risk, and team performance.	As a manager, I want to see ticket status and workload clearly so that I can monitor the team and step in when needed.
Agentforce	Read the ticket details, decide the priority, trigger the approved automation, and return the result.	As an AI service agent, I want to analyze ticket details and trigger the required automation so that tickets are processed correctly.

4. Salesforce Features and Tools

Feature / tool	How it is used
Custom object	Stores the support ticket records.
Custom fields	Hold ticket, customer, priority, status, assignment, and SLA details.
Salesforce Flow	Runs the backend automation for ticket processing and assignment.
Agentforce	Reads ticket information and decides the priority level.
Salesforce Task	Creates a work item for each high-priority ticket.
Lookup relationships	Link tickets to Accounts, Contacts, and Salesforce Users.
Reports	Give a structured view of ticket data and support performance.
Dashboards	Show ticket status, priority, and workload visually.
Users and permissions	Control who can see and do what, based on their role.

Technology stack: Salesforce Platform, Agentforce, Salesforce Flow, Salesforce Reports, Salesforce Dashboards

5. Data Model and Security Model

5.1 Data Model

Custom object: Support Ticket Intelligence **API name:** Support_Ticket_Intelligence__c

Field	Data type	Purpose
Ticket Number	Auto Number	Unique ID for each ticket.
Customer	Lookup (Account)	Links the ticket to the customer's account.
Contact	Lookup (Contact)	Links the ticket to the right contact person.
Issue Type	Picklist	Marks the issue as Technical, Billing, or General.
Description	Long Text Area	Holds the customer's description of the issue.
Priority Level	Picklist	Low, Medium, or High.
Status	Picklist	New, In Progress, or Resolved.
Created Date	Date	Date the ticket was created.
Assigned To	Lookup (User)	The support agent handling the ticket.
SLA Breach Risk	Checkbox	Ticked when the ticket may miss its SLA.
Resolution Time	Number	Time taken to resolve the ticket.

5.2 Data Relationships

Account → Contact → Support Ticket Intelligence

Each Support Ticket Intelligence record keeps together the issue details, priority, status, assigned agent, SLA risk, and resolution information for one customer request.

5.3 Security Model

Role	Access needed
Customer	Create support requests and view information about their own requests.
Support agent	View assigned tickets, update ticket status, and work on assigned tasks.
Support manager	View all tickets, monitor workload and SLA risk, and use reports and dashboards.
Agentforce	Analyze permitted ticket information and run approved Flow automation.

Security goal: Access to customer and ticket information should match each user's responsibilities, so people can only do what their role requires.
